New Ideas

New York Times Service

FRAUDULENT toll telephone calls are commonly made with an instrument called the "blue box," according to a Canadian inventor. The cheater first makes a call to a near toll office, and then uses the blue box to switch it to a distant office. He is billed only for a short first call, not for the long one.

David C. Naylor was granted Patent 4001513 this week for apparatus to detect the fraud. The change to the longer distance is exposed. The operating company then has the choice of canceling the call or billing the customer for his more expensive second choice. The patent is assigned to the Northern Electric Co. Ltd., Montreal.

Fraudulent Phone Use Is Foiled by a Detector

Fraudulent toll telephone calls are commonly made with an instrument called the "blue box," according to a Canadian inventor. The cheater first makes a call to a near toll office, and then uses the blue box to switch it to a distant office. He is billed only for the short first call, not for the long one.

David C. Naylor was granted Patent 4,001,513 this week for apparatus to detect the fraudulence. The change to the longer distance is exposed. The operating company then has the choice of canceling the call or billing the customer for his more expensive second choice. The patent is assigned to the Northern Electric Company Ltd., Montreal.
